

Attorney's Docket No.: 10559/458001/P10869
Intel Corporation**Listing of Claims**

This listing of claims replaces all prior versions, and listings, of claims in the application:

1. (Previously Presented) A method comprising:
 - defining a key and a set of values, the key able to be derived using the values and a predefined relationship between the values;
 - sending a first value of the set, but not all of the values of the set and information encrypted using the key to a server for storage; and
 - sending a second value of the set, but not all of the values of the set to a first delegate, wherein the encrypted information is accessible with the key,
 - inaccessible with the first of the values of the set absent the second of the values of the set, and
 - inaccessible with the second of the values of the set absent the first of the values of the set.

2. (Previously Presented) The method of claim 1 further comprising:

- generating a second set of values, the key being determinable by the values of the second set;
- sending a first but not all of the values of the second set

Intel Corporation

to the server; and

 sending a second but not all of the values of the second set to a second delegate,

 wherein the encrypted information is

 inaccessible with the first of the values of the second set absent the second of the values of the second set,
 and

 inaccessible with the second of the values of the second set absent the first of the values of the second set.

3. (Previously Presented) The method of claim 2 in which the values of the second set are also determinable by the predefined relationship.

4. (Original) The method of claim 1 in which the set includes exactly two values.

5. (Original) The method of claim 1 in which the set includes three or more values.

6. (Previously Presented) The method of claim 1 in which the first value is associated with a descriptor of the first delegate.

7. (Previously Presented) The method of claim 1 in which the probability of guessing the key correctly using knowledge of one or more of the values of the set, but not all the values of

Intel Corporation

the set, is the same as the probability of guessing the key correctly using no knowledge of any value of the set.

8. (Previously Presented) The method of claim 7 in which the predefined relationship comprises one or more of the Boolean XOR function and a relationship that applies an encryption algorithm to one value of the set using another value of the set as the encryption algorithm key.

9. (Original) The method of claim 1 in which the information comprises medical information.

10. (Previously Presented) A method comprising:
storing, on a server accessible through a network, secured information and a first access component, access to the secured information requiring a key, the key able to be derived using the first access component, a second access component, and a relationship between the first and second access components; excluding both the key and the second access component from storage on the server; and
providing the secured information and the first access component to a first requestor.

11. (Canceled)

12. (Previously Presented) The method of claim 10 further comprising storing a third access component on the server, the

Intel Corporation

third access component, when combined with a fourth access component that is excluded from storage on the server, being sufficient to permit access to the secured information.

13. (Original) The method of claim 12 further comprising providing the secured information and the third access component to a second requestor.

14. (Original) The method of claim 12 further comprising deleting the third access component in response to a trigger, the trigger being a client instruction, a time limit, a request from the first requestor, or a security breach.

15. (Original) The method of claim 12 further comprising identifying the requestor and determining that the requestor requires the first access component but not the third access component.

16. (Previously Presented) The method of claim 10 further comprising storing permission information about a party approved for access, such that the secured information and the first access component are only provided if the first requestor is the approved party.

17. (Original) The method of claim 10 in which the secured information is secured by encryption using a key, and

Attorney's Docket No.: 10559/458001/P10869
Intel Corporation

the first and second access components are related to the key by a predefined relationship.

18. (Previously Presented) A method comprising:
receiving

a) from a client, a first access component;
b) from a server accessible through a network, secured information, access to the secured information requiring a key, the key able to be derived using the first access component and a second access component, and
c) from a source other than the client or the server, the second access component,

wherein the encrypted information is
accessible with the key,
inaccessible with the first access component absent
the second access component, and
inaccessible with the second access component absent
the first access component.

19. (Original) The method of claim 18 in which the source is the server.

20. (Canceled)

Attorney's Docket No.: 10559/458001/P10869
Intel Corporation

21. (Original) The method of claim 18 in which a third access component is required in addition to the first and second access components for use of the secured information.

22. (Original) The method of claim 18 in which the secured information, the first access component, and the second access component are received in a digital form.

23. (Previously Presented) An article comprising a machine-readable medium that stores machine-executable instructions, the instructions being operable to cause a machine to:

define a key and a set of values, the key able to be derived using the values and a predefined relationship between the values;

send a first but not all of the values of the set and information encrypted using the key to a server for storage; and send a second but not all of the values of the set to a first delegate,

wherein the encrypted information is

accessible with the key,

inaccessible with the first of the values absent the second of the values, and

inaccessible with the second of the values absent the first of the values.

Intel Corporation

24. (Previously Presented) The article of claim 23 in which the instructions further cause a machine to:

generate a second set of values, the key being independently determinable by the values of the second set;

send a first but not all of the values of the second set to the server; and

send a second but not all of the values of the second set to a second delegate,

wherein the encrypted information is inaccessible with the first of the values of the second set absent the second of the values of the second set, and

inaccessible with the second of the values of the second set absent the first of the values of the second set.

25. (Previously Presented) An apparatus comprising a processor and instructions configured to cause the processor to:

receive, from a client, information and a value of a set of values, the information being encrypted using a key, the key able to be derived using the values of the set and a predefined relationship between the values;

store the information and the value, but not all the values of the set; and

transmit, to a delegate, the information and the value.

Intel Corporation

26. (Original) The apparatus of claim 25 in which the software is further configured to cause the processor to:

store a second value that is a member of a second set of values, the values of the second set being sufficient to determine the key using the predefined relationship.

27. (Previously Presented) The apparatus of claim 26 in which the software is further configured to cause the processor to:

delete or deny access to the second value in response to a trigger, the trigger being a client instruction, a time limit, a request from the delegate, or a security breach.

28. (Original) The apparatus of claim 25 in which the information comprises medical information.

Claims 29-30. (Canceled)

31. (Previously Presented) The method of claim 1 further comprising sending, to the server, instructions for allowing the first delegate to access the first of the values.

32. (Previously Presented) The method of claim 18, further comprising sending authentication information to the source other than the client or the server to access the second access component.
